

SAI UNIVERSITY TECH FEST 2026: AN HTML5-BASED EVENT INFORMATION AND REGISTRATION WEBSITE

Suhaas Sarabu
Sai University, Chennai, Tamil Nadu, India

Abstract— This paper presents the design and implementation of a simple HTML5-based website for Sai University Tech Fest 2026. The website organizes event information, highlights, competitions, event schedules, registration details, an event image, and an embedded YouTube video in a single web page. The implementation demonstrates semantic HTML5 structure, internal navigation, lists, tables, forms, input controls, images, and iframe-based

media embedding. The registration form supports participant details, event selection, participation type, skills, preferred date, portfolio URL, and additional comments. The resulting page provides a clear foundation for a university event portal and can be extended with CSS, JavaScript, backend processing, and database support.

Index Terms— HTML5, event website, web development, registration form, semantic HTML, YouTube iframe

I. INTRODUCTION

University technology festivals bring together students for technical challenges, project demonstrations, knowledge-based activities, and innovation. Presenting these activities through a dedicated website helps participants quickly locate event information and understand how to register.

The Sai University Tech Fest 2026 website was developed as an academic HTML5 project. The page follows a logical structure consisting of a header, navigation menu, content sections, registration form, media, and footer. Internal hyperlinks connect the navigation menu to the relevant sections of the document.

II. OBJECTIVES

The main objectives of the project are:

- 1) To create a structured event website using HTML5.
- 2) To present event highlights, competitions, and the event schedule.
- 3) To implement a practical participant registration form.
- 4) To demonstrate HTML lists, tables, links, images, and form controls.
- 5) To embed a YouTube video without storing the video file locally.

III. SYSTEM DESIGN AND PAGE ORGANIZATION

The webpage is organized into independent sections. Each major section is assigned an ID so that anchor elements in the navigation menu can move directly to that section.

A. Header and Navigation

The header contains the title “Sai University Tech Fest 2026” and the tagline “Innovate - Build - Compete”. The navigation menu links to About, Schedule, Competitions, Event Video, and Registration sections.

B. About Section

The About section introduces the Tech Fest and communicates the central idea of innovation, building, and competition. Text-formatting elements are used to emphasize important words.

C. Event Highlights

An unordered list presents the major activities, including inauguration, coding challenge, technology quiz, project exhibition, and prize distribution.

D. Competitions

The competition section describes four activities: Coding Challenge, Web Design Challenge, Technology Quiz, and Innovation Showcase. Each activity is briefly explained for participants.

E. Event Schedule

An HTML table presents the timetable using the columns Time, Event, Venue, and Coordinator. This format makes the schedule easy to scan and demonstrates table structure using thead, tbody, tr, th, and td elements.

Time	Event	Venue
09:00 AM	Opening Ceremony	Main Auditorium
10:00 AM	Coding Challenge	Computer Lab
11:30 AM	Innovation Showcase	Innovation Hall
01:00 PM	Technology Quiz	Seminar Hall

Time	Event	Venue
02:30 PM	Web Design Challenge	Digital Lab
04:00 PM	Prize Distribution	Main Auditorium

TABLE I. EVENT SCHEDULE

IV. REGISTRATION FORM

The registration form is a central interactive component of the website. It collects the participant's full name, email address, mobile number, age, selected event, participation type, technical skills, preferred event date, portfolio URL, and additional comments.

A. Input Controls

Different HTML5 controls are used according to the type of information required. Text input is used for the participant name, email input for the email address, telephone input for the mobile number, number input for age, date input for the preferred date, and URL input for a portfolio address.

B. Selection Controls

A select menu provides event choices. Radio buttons allow the participant to choose either Individual or Team participation. Checkboxes allow multiple skills such as Programming, Web Development, Database, Artificial Intelligence, and UI/UX Design to be selected.

C. Validation and Actions

Required fields are marked with the HTML required attribute. The form includes Submit Registration and Reset buttons. In the current HTML-only implementation, the form is a front-end interface and does not persist data to a database.

V. MULTIMEDIA INTEGRATION

The project includes an event poster using the HTML img element. In addition, a YouTube event video can be embedded directly using an iframe. This approach avoids downloading or storing the video in the repository and allows the browser to load the content from YouTube.

Example: `iframe src="https://www.youtube.com/embed/VIDEO_ID"`

VI. IMPLEMENTATION

The implementation uses a single index.html file with an HTML5 document declaration and standard metadata. Semantic elements such as header, main, section, and footer divide the page into meaningful areas. The document also uses headings, paragraphs, emphasis tags, lists, tables, labels, input elements, select, textarea, buttons, image, and iframe elements.

The project does not depend on a CSS framework or JavaScript library. This keeps the implementation simple and makes the source code suitable for demonstrating basic HTML concepts in a laboratory setting.

VII. RESULTS AND DISCUSSION

The completed webpage provides a single location for event information and participant interaction. Users can navigate through the event description, review highlights and competitions, inspect the schedule, view media, and complete the registration form.

The project demonstrates that core HTML5 features are sufficient to create a functional information-oriented web page. However, the current implementation is intentionally focused on structure rather than advanced visual design or server-side processing.

VIII. ADVANTAGES

- Simple and readable HTML structure.
- Organized information using semantic sections.
- Multiple practical HTML5 form controls.

- Internal navigation between page sections.
- YouTube media can be embedded without local video storage.

IX. LIMITATIONS

The current version has minimal styling and does not implement server-side form processing. Submitted registration data is therefore not stored. Advanced client-side validation, authentication, database support, and organizer-side management are outside the present scope.

X. FUTURE ENHANCEMENTS

Future work can add CSS-based responsive design, JavaScript validation, animated user-interface components, backend services, database storage, participant confirmation, registration status tracking, and an organizer dashboard. Accessibility improvements and mobile-first design can also be incorporated.

XI. CONCLUSION

The Sai University Tech Fest 2026 project successfully demonstrates the development of an event-information and registration webpage using HTML5. The system combines structured content, navigation, lists, tables, forms, images, and external video embedding in one page. The project provides a practical foundation that can be expanded into a complete event-management platform using CSS, JavaScript, backend technologies, and a database.
