

SAI UNIVERSITY TECH FEST 2026: AN HTML5 AND CSS3 EVENT WEBSITE

IEEE-Style Academic Project Report

Suhaas Sarabu

Sai University, Chennai, Tamil Nadu, India

Abstract— This paper presents the design and implementation of a front-end website for Sai University Tech Fest 2026 using HTML5 and CSS3. The website contains a header, internal navigation, event introduction, highlights, competition descriptions, a structured event schedule, a participant registration form, a Tech Fest poster, and a footer. HTML5 provides semantic structure and multiple form controls, while an external CSS stylesheet controls typography, colors, spacing, borders, cards, forms, images, and section presentation. The project demonstrates fundamental web-development concepts appropriate for an academic HTML/CSS laboratory project.

Index Terms— HTML5, CSS3, Web Design, Event Website, HTML Forms, Tables, Semantic HTML, Internal Navigation.

I. INTRODUCTION

Web technologies provide a practical method for publishing structured information through a browser. For a university Tech Fest, an event webpage can present event information and guide participants toward registration. This project focuses on HTML5 and CSS3 fundamentals rather than scripting or server-side processing. The HTML document defines structure and content, while the linked external stylesheet defines the visual presentation.

II. OBJECTIVES

The objectives are to create a complete event webpage using HTML5; demonstrate semantic elements; implement internal navigation; present information with lists and tables; build a registration form using different HTML5 input types; display an event poster; and apply external CSS selectors, colors, spacing, borders, and typography.

III. TECHNOLOGY STACK

The supplied implementation uses HTML5 and CSS3. The HTML file includes UTF-8 character encoding, a viewport declaration, a page title, and an external stylesheet link. The page uses header, nav, main, section, article, table, form, image, and footer elements. The stylesheet uses element, class, and ID selectors. No JavaScript, database, authentication, or server-side component is included.

HTML5 example:

```
<section id="competitions">
  <h2 class="section-title">Competitions</h2>
  <article class="event-card featured">
    <strong>Coding Challenge</strong>
    <p>Test your programming and problem-solving skills.</p>
  </article>
</section>
```

IV. PAGE ARCHITECTURE

The page follows a hierarchical structure. A header contains the title, tagline, and navigation. The main element contains About The Event, Event Highlights, Event Participation, Competitions, Event Schedule, registration, and poster sections. The footer contains event identity, university information, contact details, and repeated navigation links. Internal IDs—about, schedule, competitions, and register—are connected through anchor links.

Page flow: Header → About → Highlights/Participation → Competitions → Event Schedule → Registration → Poster → Footer.

V. EVENT MODULES

The competition module uses semantic article elements for Coding Challenge, Web Design Challenge, Technology Quiz, and Innovation Showcase. Event cards are styled through the event-card class, with the Coding Challenge additionally using the featured class. The schedule module presents Time, Event, Venue, and Coordinator columns. The listed activities run from the 09:00 AM Opening Ceremony through the 04:00 PM Prize Distribution.

VI. REGISTRATION FORM

The registration form demonstrates text, email, telephone, number, select, radio, checkbox, date, URL, and textarea controls. It collects full name, email, mobile number, age, selected event, participation type, technical skills, preferred event date, portfolio URL, and additional comments. The form uses browser-side HTML attributes including required, min, and max. It provides Submit Registration and Reset buttons. Since no backend is supplied, the project does not persist submitted participant data.

Example HTML5 validation:

```
<input class="form-control" type="number" id="age" name="age" min="16"
max="30" required>
```

VII. CSS DESIGN

The external stylesheet establishes the visual hierarchy. The body uses Arial typography and a warm RGB background. Headings use larger font sizes and a dark red accent. Tables, buttons, event cards, form groups, form controls, images, and the footer are styled through reusable classes. ID selectors provide section-specific styling for #about, #schedule, #register, and #event-schedule.

Selected CSS:

```
body { font-family: Arial, sans-serif; background-color: rgb(214,169,139); }
.event-card { background-color: white; border: 2px solid rgb(150,56,33);
padding: 15px; margin: 10px; }
.footer { background-color: black; color: white; padding: 20px; text-align:
center; }
```

VIII. POSTER AND INTERFACE

The project includes a Tech Fest Poster section using an image element with alternative text. The supplied poster is used as the visual event asset. Navigation buttons provide direct movement to the major sections, while the event cards and table separate information into readable blocks.

Fig. 1. Tech Fest poster supplied with the project.

IX. TESTING AND RESULTS

Testing consists of opening the HTML file in a modern browser and verifying the stylesheet connection, internal navigation, competition cards, schedule table, form controls, validation attributes, poster path, and footer links. The implementation demonstrates the intended HTML5/CSS3 learning outcomes: structured content, semantic organization, forms, tables, internal navigation, and external styling.

X. LIMITATIONS AND FUTURE SCOPE

The current implementation is intentionally limited to HTML5 and CSS3. It does not contain JavaScript interactions, server-side registration, database connectivity, authentication, payment processing, or persistent participant records. Future work could add dynamic interaction, refined responsive layouts, backend form processing, database storage, event search/filtering, and an administrative dashboard.

XI. CONCLUSION

The Sai University Tech Fest 2026 website demonstrates how HTML5 and CSS3 can be combined to build a complete academic event webpage. The project integrates semantic sections, internal navigation, competition cards, a structured schedule table, a multi-control registration form, an event poster, and a styled footer. It provides a clear foundation for progressing from static webpages toward interactive and data-driven applications.
